1. Change Request Identification

Table 1. Change Request Identification

This table summarizes the basic identification data of the SCI, including its code, type, priority, recommended decision, and the affected project scope.

Field	Detail
SCI Code	SCI-02
Change name	Mandatory reporting of services and employees due to a legal requirement
Change type	Regulatory change / compliance requirement
Suggested priority	High
Recommended decision	Approve with high priority because it affects the legal operation of the business.
Affected project	Cleaning service management system: mobile application, administrative CRM, and operational modules.

2. Description of the Requested Change

The government issued a new law requiring cleaning companies to report the services performed and the employees who participated in each service for safety reasons. This requires the system to register, preserve, and generate traceable reports that connect the service, client, location, date, assigned employees, and administrative evidence.

3. Change Justification

- The company must comply with an external legal obligation; failing to address the change may result in sanctions or operational restrictions.
- Recording employees by service improves traceability and allows the company to respond to audits or incidents.
- The change strengthens security, internal control, and transparency with clients and authorities.

4. Proposed Functional Scope

- Record which employees were assigned to each cleaning order or service.
- Store date, time, location, client, service type, and service status.
- Allow the administrator to generate reports filtered by date, city, employee, client, or service.
- Include a change history whenever employee assignments are modified.
- Export reports in administrative formats, such as Excel or PDF.

5. Change Impact

Table 2. Expected Impact by Area

This table identifies the areas of the system affected by the change and describes the expected technical, operational, and documentation impact.

Area	Expected impact
Backend	Add relationships between service orders, assigned employees, and regulatory reports. Create endpoints for queries, filters, and exports.
Database	New tables or fields for assignments, auditing, history, and report metadata.
CRM frontend	Screens to assign employees, review history, and generate

Area	Expected impact
Mobile application	reports. May require showing employees their assigned services, although the core of the change remains in the CRM and backend.
Security	Role-based access control, logs, and protection of employee and client personal data.
Documentation	Update requirements, technical manual, user manual, and traceability matrix.

6. Identified Risks

Table 3. Identified Risks and Mitigation Actions

This table presents the main risks associated with the change, their severity level, and the mitigation strategy proposed to reduce their impact.

Risk	Level	Mitigation
Incorrect handling of employee personal data.	High	Apply access control, encryption, retention policies, and audit logging.
Incomplete reports or reports not accepted by the authority.	Medium-High	Validate minimum required fields and design configurable reports.
Increased operational workload for administrators.	Medium	Automate report generation and use simple filters.
Errors when assigning employees to services.	Medium	Use validations, change history, and confirmation before closing the service.

7. Preliminary Estimate

Table 4. Preliminary Effort Estimate

This table estimates the effort required to analyze, implement, test, and document the requested change.

Activity	Estimated effort
Analysis of legal fields and business rules	4 to 6 hours
Database and relationship adjustments	5 to 7 hours
Backend endpoints and validations	8 to 12 hours
CRM screens and filters	8 to 10 hours
Report export functionality	4 to 6 hours
Testing and documentation	5 to 8 hours
Total estimated effort	34 to 49 hours

8. Acceptance Criteria

- The system allows one or more employees to be assigned to each service.
- Each closed service preserves the employee, date, client, location, and service type records.
- The administrator can generate reports by date range and export them.
- Only authorized users can access reports containing personal data.
- Every modification to employee assignments is recorded in an audit log.

9. Change Control Board Decision

The recommendation is to approve the change because it responds to a legal obligation and reduces compliance risks. It should be implemented before other improvement changes because it directly affects the ability to operate safely and in accordance with regulations.

10. Conclusion

SCI-02 is a necessary and high-priority change. Although it increases the scope of the system, it also strengthens traceability, security, and audit capability. Its implementation must be controlled through requirement versioning, traceability matrix updates, and security testing over the reported information.
